Principles of Database Systems (CS307)

Lecture 6: More about NULL; Ordering; Window Function

Yuxin Ma

Department of Computer Science and Engineering Southern University of Science and Technology

- Most contents are from slides made by Stéphane Faroult and the authors of Database System Concepts (7th Edition).
- Their original slides have been modified to adapt to the schedule of CS307 at SUSTech.

More about NULL

Expressions with NULL Values

- Most expressions with NULL will be evaluated into NULL
 - Arithmetic operations:

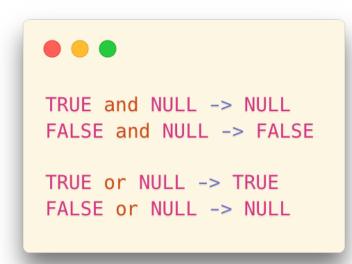

```
col+NULL -> NULL
col-NULL -> NULL
col*NULL -> NULL
col/NULL -> NULL
```

Comparison operations:

```
(col > NULL) -> NULL
(col = NULL) -> NULL
```

Expressions with NULL Values

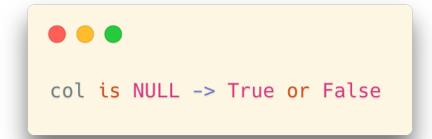

- Most expressions with NULL will be evaluated into NULL
 - But, there are some conditions where the values are not NULL

Logical operators (or, and):

• Three-valued logic (true, false, and unknown)

More on this: Three-valued logic and its application in SQL https://en.wikipedia.org/wiki/Three-valued logic#SQL

The way we use to check a NULL value: use is, not =

Recall: Subquery after Where

- Some important points for in()
 - in() means an <u>implicit distinct</u> in the subquery
 - in('cn', 'us', 'cn', 'us', 'us') is equal to in('cn', 'us')
 - null values in in()
 - Be extremely cautious if you are using not in(...) with a null value in it

```
value not in(2, 3, null)

⇒ not (value=2 or value=3 or value=null)

⇒ value<>2 and value<>3 and value<>null

⇒ false -- always false or null, never true
```

- If value is 2, the result is:
 TRUE and FALSE and NULL -> FALSE
- if value is 5, the result is:
 TRUE and TRUE and NULL -> NULL
- if value is NULL, the result is:
 NULL and NULL -> NULL

Ordering

- order by
 - A simple expression in SQL to order a result set
 - It comes <u>at the end of a query</u>
 - ... and, you can have it in subqueries, definitely
 - Followed by the list of columns used <u>as sort columns</u>

```
select title, year_released
from movies
where country = 'us'
order by year_released;
```

	.⊞ title ÷	.≣ year_released ÷
1	Ben Hur	1907
2	The Lonely Villa	1909
3	From the Manger to the Cross	1912
4	Falling Leaves	1912
5	Traffic in Souls	1913
6	At Midnight	1913
7	Lime Kiln Field Day	1913
8	The Sisters	1914
9	The Only Son	1914
10	Tess of the Storm Country	1914
11	Under the Gaslight	1914
12	Brute Force	1914
13	The Wishing Ring: An Idyll of Old England	1914

 No matter how difficult the query is, you can apply order by to any result set

	.⊞ title ÷	. ≣ year_released ÷
1	Snehaseema	1954
2	Nairu Pidicha Pulivalu	1958
3	Mudiyanaya Puthran	1961
4	Puthiya Akasam Puthiya Bhoomi	1962
5	Doctor	1963
6	Aadyakiranangal	1964
7	Odayil Ninnu	1965
8	Adimakal	1969
9	Karakanakadal	1971
10	Ghatashraddha	1977
11	Kramer vs. Kramer	1979
12	The Champ	1979
13	The Shining	1980

- Ordering with joins
 - We can sort by any column of any table in the join (remember the super wide table with all the columns from all tables involved)

	■ country_name	III title	
1	India	Snehaseema	1954
2	India	Nairu Pidicha Pulivalu	1958
3	India	Mudiyanaya Puthran	1961
4	India	Puthiya Akasam Puthiya Bhoomi	1962
5	India	Doctor	1963
6	India	Aadyakiranangal	1964
7	India	Odayil Ninnu	1965
8	India	Adimakal	1969
9	India	Karakanakadal	1971
10	India	Ghatashraddha	1977
11	United States	Kramer vs. Kramer	1979
12	United States	The Champ	1979
13	United States	The Shining	1980

- Ordering with joins
 - We can sort by any column of any table in the join (remember the super wide table with all the columns from all tables involved)

	■ country_name	III title	
1	India	Snehaseema	1954
2	India	Nairu Pidicha Pulivalu	1958
3	India	Mudiyanaya Puthran	1961
4	India	Puthiya Akasam Puthiya Bhoomi	1962
5	India	Doctor	1963
6	India	Aadyakiranangal	1964
7	India	Odayil Ninnu	1965
8	India	Adimakal	1969
9	India	Karakanakadal	1971
10	India	Ghatashraddha	1977
11	United States	Kramer vs. Kramer	1979
12	United States	The Champ	1979
13	United States	The Shining	1980

Advanced Ordering

- Multiple columns
 - For example:
 - The result set will be order by col1 first
 - If there are rows with the same value on col1, these rows will be ordered by col2.

```
order by col1, col2, ...
```

- Ascending or descending order
 - Add desc or asc after the column
 - However, asc is the <u>default option</u> and thus <u>always omitted</u>

```
-- Order coll descendingly order by coll desc

-- Order based on coll first, then col2.
-- coll will be in the descending order, col2 ascending. order by coll desc, col2 asc, ...
```

Advanced Ordering

- Self-defined ordering
 - Use "case ... when" in order by to define criteria on how to order the rows

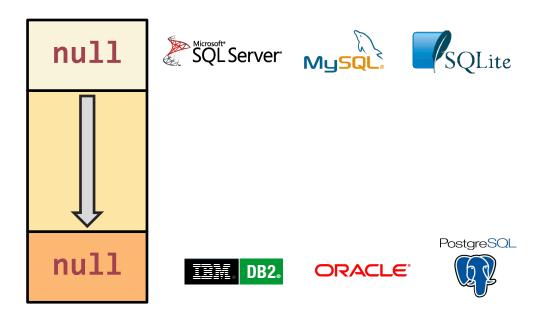

```
select * from credits
order by
case credited_as
when 'D' then 1
when 'A' then 2
end desc;
```

Data Types in Ordering

- Ordering depends on the data type
 - Strings: alphabetically,
 - Numbers: numerically
 - Dates and times: chronologically

Data Types in Ordering

- What about NULL?
 - It is implementation-dependent
 - SQL Server, MySQL and SQLite:
 - "nothing" is smaller than everything
 - Oracle and PostgreSQL:
 - "nothing" is greater than anything

Ordering in Text Data

- Remember, we have many different languages other than English
 - "Alphabetical order" in different languages means different things
 - Mandarin: Pinyin? Number of strokes?
 - Swedish and German
 - "ö" is considered the last letter in Swedish, while in German it is ordered after "o".
 - Collation

Self Study: Text Encoding

- Key Question: How does characters represented in a computer?
 - Wikipedia Character encoding: https://en.wikipedia.org/wiki/Character_encoding
 - A video on Bilibili: https://www.bilibili.com/video/BV1xP4y1J7CS

手持两把锟斤拷, 口中疾呼烫烫烫。 脚踏千朵屯屯屯, 笑看万物锘锘锘。

- Try to answer the following questions:
 - What are ASCII, Unicode, UTF-8, and UTF-16? What are the relationships between them?
 - What are GB2312, GB18030, and GBK? What are "锟斤拷" and "烫烫烫"? How can you make it (not) happen?
 - Given a string with several characters, can you print the bitmap of this string?
 - Are emojis characters? How can you insert an emoji in a text editor?
 - What are the default character encodings in different platforms?
 - OS: Windows, MacOS, Linux
 - DBMS: PostgreSQL, etc.
 - Programming Languages: Java, C, C++, Python, etc.
 - How can we translate strings from one encoding to another?
 - E.g., with text editors (Windows Notepad, VSCode, Sublime Text, etc.); in programming languages; in DBMS

Limit and Offset

- Get a slice of the long query result
 - limit k offset p
 - Return the top-k rows in the result set and skip the first p rows
 - offset is optional (which means "offset 0")
 - Always used together with order by
 - E.g., get the top-k query results under a certain ordering criteria
 - * In some DBMS, the syntax can be different
 - Always refer to the software manual for specific features

```
select * from movies
where country = 'us'
order by year_released
limit 10 offset 5
```

```
select * from movies
where country = 'us'
order by year_released
limit 10
```

Window Function

Scalar Functions and Aggregation Functions

- Scalar function
 - Functions that operate on values in the current row
 - Recall: "Some Functions", Lecture 3

```
round(3.141592, 3) -- 3.142
trunc(3.141592, 3) -- 3.141

upper('Citizen Kane')
lower('Citizen Kane')
substr('Citizen Kane', 5, 3) -- 'zen'
trim(' Oops ') -- 'Oops'
replace('Sheep', 'ee', 'i') -- 'Ship'
```

- Aggregation function
 - Functions that operate on sets of rows and return an aggregated value
 - Recall: "Aggregate Functions", Lecture 4

```
count(*)/count(col), min(col), max(col), stddev(col), avg(col)
```

Issues with Aggregate Functions

- A Problem: In aggregated functions, the details of the rows are vanished
 - For example: If we ask for the year of the oldest movie per country,
 - ... we get a country, a year, and nothing else.

```
select country,
    min(year_released) earliest_year
from movies
group by country
```

Issues with Aggregate Functions

- A Problem: In aggregated functions, the details of the rows are vanished
 - For example: If we ask for the year of the oldest movie per country,
 - ... we get a country, a year, and nothing else.

If we want some more details, like the title of the oldest movies for each country, we can only use self-join to keep the columns

• And there is also one more problem in the query on the right side. Can you find it?

```
select m1.country,
    m1.title,
    m1.year_released
from movies m1
    inner join
    (select country,
        min(year_released) minyear
        from movies
        group by country) m2
on m2.country = m1.country and m2.minyear = m1.year_released
order by m1.country
```

Issues with Aggregate Functions

- A Problem: In aggregated functions, the details of the rows are vanished
 - Another example: How can we rank the movies in each country separately based on the released year?
 - "order by" for subgroups
 - One more example: Get the top-3 oldest movies for each country.
 - How can we implement it?

Window Function

• Syntax:

```
<function> over (partition by <col_p> order by <col_o1, col_o2, ...>)
```

- <function>: we can apply (1) ranking window functions, or (2) aggregation functions
- partition by: specify the column for grouping
- order by: specify the column(s) for ordering in each group

- RANK() 这个指的是为每一组的行生成一个序号,与ROW_NUMBER()不同的是如果按照ORDER BY Example 的排序,如果有相同的值会生成相同的序号,并且接下来的序号是不连序的。例如两个相同的行生成序号3,那么接下来会生成序号5

 How can we rank the movies in each country separately based on the released year? Example
 - - "order by" for subgroups

```
select country,
       title,
       year_released,
       rank() over (
           partition by country order by year_released
       ) oldest_movie_per_country
from movies;
```

	I country ≎	■ title ÷	■ year_released ÷	■ oldest_movie_per_country	\$
1	am	Sayat Nova	1969		1
2	ar	Pampa bárbara	1945		1
3	ar	Albéniz	1947		2
4	ar	Madame Bovary	1947		2
5	ar	La bestia debe morir	1952		4
6	ar	Las aguas bajan turbias	1952		4
7	ar	Intermezzo criminal	1953		6
8	ar	La casa del ángel	1957		7
9	ar	Bajo un mismo rostro	1962		8
10	ar	Las aventuras del Capitán Piluso	1963		9
11	ar	Savage Pampas	1966		10
12	ar	La hora de los hornos	1968		11
13	ar	Waiting for the Hearse	1985		12
14	ar	La historia oficial	1985		12
15	ar	Hombre mirando al sudeste	1986		14

partition by 字段名字A:子句进行分组, partition by是固定的分组语法;

order by 字段名字B:子句进行排序, order by 是固定的排序语法。

Rank() Over (PARTITION BY classid ORDER BY score DESC)是指的先根据classid分组,然后再根据score分数倒叙排列,则是指的分组后生成Rank的序列化号

- Example
 - How can we rank the movies in each country separately based on the released year?
 - "order by" for subgroups

```
You can also add "desc" here,
select country, similar to the "order by" we
title, introduced before
year_released,

rank() over (
   partition by country order by year_released
) oldest_movie_per_country

from movies;
```

coun	title	year_released	oldest_movie_per_country
ar	some title	1948	1
ar	some title	1959	2
ar	some title	1980	3
cn	some title	1987	1
cn	some title	2002	2
uk	some title	1985	1
uk	some title	1992	2
uk	some title	2010	3

partition by country

 the selected rows will be grouped (partitioned) according to the values in the column country

rank()

- A function to say that "I want to order the rows in each partition"
- No parameters in the parentheses

order by year_released

• In each group (partition), the rows will be ordered by the column "year_released"

- Example
 - How can we rank the movies in each country separately based on the released year?
 - "order by" for subgroups

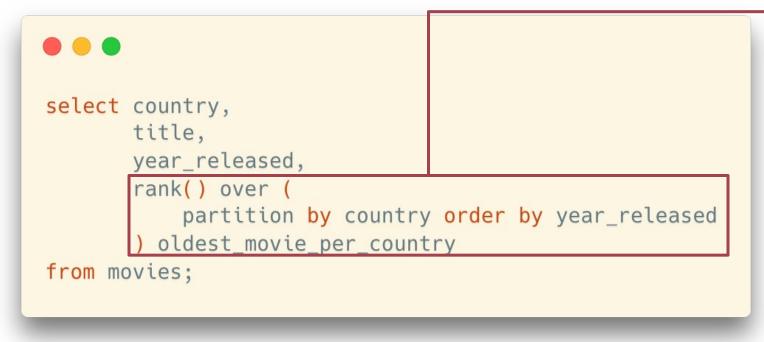

```
select country,
    title,
    year_released,
    rank() over (
        partition by country order by year_released
    ) oldest_movie_per_country
from movies;
```

coun try	title	year_released	oldest_movie_per_country
ar	some title	1948	1
ar	some title	1959	2
ar	some title	1980	3
cn	some title	1987	1
cn	some title	2002	2
uk	some title	1985	1
uk	some title	1992	2
uk	some title	2010	3

Note: partition functions can only be used in the select clause

• ... since it is designed to work on the query result

- Example
 - How can we rank the movies in each country separately based on the released year?
 - "order by" for subgroups

	coun try	title	year_released _		ldest_movie_per_country		
Γ	ar	some title	1948		1		
	ar	some title	1959		2		
	ar	some title	1980		3	İ	
Ī	cn	some title	1987		1	I	
	cn	some title	2002		2	I	
	uk	some title	1985 I		1		
	uk	some title	1992 I		2		
	uk	some title	2010		3		
						•	

Partitioned by country

• i.e., a country in a group

An order value is computed for each row in a partition.

Only inside the partition, not across the entire result set

- Why window function, not group by?
 - "Group by" reduces the rows in a group (partition) into one result, which is the meaning of "aggregation"
 - Then, the values in non-aggregating columns are vanished
 - Window functions do not reduce the rows
 - Instead, they attach computed values next to the rows in a group (partition) and keep the details
 - Actually, the partition here means "window": an affective range for statistics

dense_rank:在计算排序时,若存在相同位次,不会跳过之后的位次。

Some more ranking window functions

row_number: 为结果集的分区中的每一行分配一个连续的整数。 行号以每个分区中第一行的行号开头。

- Besides rank(), we also have dense_rank() and row_number()
- The difference is about <u>how they treat rows with the same rank</u>

```
select country,
    title,
    year_released,

rank() over (
        partition by country order by year_released
) rank_result,

dense_rank() over (
        partition by country order by year_released
) dense_rank_result,

row_number() over (
        partition by country order by year_released
) row_number_result
from movies;
```

co un tr y	title	year_ relea sed	rank_result	dense_rank_result	row_number_result
cn	some title	1948	1	1	1
cn	some title	1959	2	2	2
cn	some title	1959	2	2	3
cn	some title	1987	4	3	4
cn	some title	2002	5	4	5
uk	some title	1985	1	1	1
uk	some title	1992	2	2	2
uk	some title	2010	3	3	3

Aggregation Functions as Window Functions

max(col) and min(col)

```
select country,
    title,
    year_released,
    min(year_released) over (
        partition by country order by year_released
    ) oldest_movie_per_country
from movies;
```

	III cou ÷	I title	■ year_released ÷	■ oldest_movie_per_country ÷
1	am	Sayat Nova	1969	1969
2	ar	Pampa bárbara	1945	1945
3	ar	Albéniz	1947	1945
4	ar	Madame Bovary	1947	1945
5	ar	La bestia debe morir	1952	1945
6	ar	Las aguas bajan turbias	1952	1945
7	ar	Intermezzo criminal	1953	1945
8	ar	La casa del ángel	1957	1945
9	ar	Bajo un mismo rostro	1962	1945
10	ar	Las aventuras del Capitán Piluso	1963	1945
11	ar	Savage Pampas	1966	1945
12	ar	La hora de los hornos	1968	1945
13	ar	Waiting for the Hearse	1985	1945
14	ar	La historia oficial	1985	1945
15	an	Hombro minando al sudosto	1026	1045

The min/max value for each partition is assigned for all the rows inside this partition

Aggregation Functions as Window Functions

- sum(col), count(col), avg(col), stddev(col), etc.
 - Different from min/max: for these aggregation functions, it means the aggregation
 value from the first row to the current row in its partition when order by is specified

```
select country,
    title,
    year_released,
    sum(runtime) over (
        partition by country order by year_released
    ) total_runtime_till_this_row
from movies;
```

		II ÷	⊞ title ÷	I ∄ year_released ÷	■ total_runtime_till_this_row ÷
	1	am	Sayat Nova	1969	78
	2	ar	Pampa bárbara	1945	98
	3	ar	Albéniz	1947	308
Ш	4	ar	Madame Bovary	1947	308
Т	5	ar	La bestia debe morir	1952	494
	6	ar	Las aguas bajan turbias	1952	494
	7	ar	Intermezzo criminal	1953	494
	8	ar	La casa del ángel	1957	570
	9	ar	Bajo un mismo rostro	1962	695
	10	ar	Las aventuras del Capitán Piluso	1963	785
	11	ar	Savage Pampas	1966	897
	12	ar	La hora de los hornos	1968	1157
	13	ar	Waiting for the Hearse	1985	1354
	14	ar	La historia oficial	1985	1354

However, if there is no order by, the behavior will be similar to min() and max()

One result for all rows

Pay attention to the behavior on rows with the same rank:

They are "treated like the same row" here

Exercise

- Question: How can we get the top-5 most recent movies for each country?
 - Hint: Use a subquery in the "from" clause

Exercise

- Question: How can we get the top-5 most recent movies for each country?
 - Hint: Use a subquery in the "from" clause

```
select x.country,
       x.title,
       x.year_released
from (
 select country,
        title,
        year_released,
        row_number()
        over (partition by country
              order by year_released desc) rn
from movies) x
where x.rn \le 5
```
